

Appendix I

Turtle Platform Blueprint

The turtle platform should be anchored to the bottom of the lake to prevent it from floating ashore. A concrete filled five-gallon bucket makes a good anchor. Enough line should be provided to allow the platform to rise and fall as the water level changes. Floatation devices, such as dock bumpers, will need to be fixed to the underside of the platform.

- a. Turtle platform design and dimensions. The platform is made up of a framework of 2x4's and plywood. The plywood should be covered with a durable indoor/outdoor carpeting material.

- b. The frame design for a turtle platform. The floatation devices can be placed between 2x4's.
